

Sentiment analysis tool

Manage and execute n8n workflow for sentiment analysis directly from Streamlit

Execute Workflow via Webhook

Quick Execute

Activate the workflow:

- Click the "Analyze Sentiments" toggle (top-right) to make it always available

Enter company you want to find sentiment of:

apple

Analyze Sentiments

Webhook activated successfully!

Dataset overview

- Rows analyzed: 30 (row 2–31)
- Fields: `Text`, labeled `sentiment`

Sentiment analysis (distribution)

Count by labeled sentiment:

- **Positive:** 18 (60%)
- **Neutral:** 5 (16.7%)

- **Negative:** 7 (23.3%)

What's driving each sentiment

- **Positive:** excitement/enjoyment (“great day”, “amazing journey”, “fun”, “addicting”), plus upbeat business results (“net sales rose”, “sales doubled”, “zero pre-tax profit”).
- **Negative:** complaints/frustration (“Don’t angry me”, “Nonsense”), and adverse finance/news (“down... BK possibility”, “shareholder skepticism”, “results... remain at loss”).
- **Neutral:** status updates / short vague phrases (“2 am...”, “Both of you”), and factual business statements without clear valence (stake sold, companies operating).

Topic analysis (dominant themes)

I grouped texts into recurring themes based on keywords and intent:

1. Mobile game/app reviews (very dominant, mostly positive)

- Rows 12–21: repeated mentions of “game”, “levels”, “golden eggs”, “free”, “ads”, “addictive”, “kids/grandkids love it”.
- Sentiment: overwhelmingly **positive** (minor frustration noted but still recommended).

2. Personal life / emotions / brief status updates

- Rows 2–11: day quality, missing someone, anger, “2 am” updates, baby feeding, “sooo high”, travel by boat.
- Sentiment: mixed but leans **positive/neutral**; one clear complaint (“Don’t angry me”).

3. Finance & business news / stock-market commentary

- Rows 22–31: GPS/location tech partnership, quarterly sales, construction in Russia, stake sale, market ticker comments (**ESI**, SPY), M&A skepticism, company loss outlook, retail expansion.
- Sentiment: mixed; **positive** for strong financial performance, **negative** for loss/skepticism/down moves, **neutral** for purely factual items.

4. School/class complaint

- Row 5: complaint about teaching style (“reading on slide... Nonsense”).
- Sentiment: **negative**.

Notable patterns / data quality notes

- The dataset appears to mix **three distinct domains**: casual social posts, **game reviews**, and **formal financial news**. Topic modeling will strongly separate along these domains.
- A few texts are very short/ambiguous (“Both of you”), which naturally cluster poorly and skew toward “neutral”.

If you want, I can return (a) a topic label per row, (b) top keywords per topic, and (c) a confusion check: whether any labeled sentiments look inconsistent with the text.
