Aligna

**Where brand voice stops being
subjective and becomes a decision**

Aligna is an AI platform that evaluates content against brand voice and delivers clear, explainable decisions before it goes live.

A brand quality layer for marketing teams — not another AI content generator.

THE PROBLEM

Teams don't struggle to create content anymore. They struggle to keep it consistent.

As content scales across teams and channels, maintaining a consistent brand voice becomes increasingly difficult.

Multi-Channel Chaos

Content is created across social, email, and landing pages — with no unified quality gate.

Guidelines That Go Ignored

Brand guidelines exist but are rarely followed in real workflows.

Subjective Feedback

"This doesn't feel right" — feedback without a framework slows decisions.

Manual Review Bottlenecks

Manual review slows publishing and creates inconsistent standards.

Chaos

Consistency

THE SOLUTION

Aligna is a Brand Voice QA System

It sits between content creation and publishing to ensure everything is on-brand.

Turning subjective feedback into structured decisions.

We don't generate content. We validate it.

Who Aligna Is Built For

UVP

Aligna ensures every piece of content matches brand voice by delivering explainable decisions before publishing.

Target Users

Marketing Teams

Scaling content across diverse channels and campaigns without losing brand integrity.

Brand Managers

Responsible for defining, maintaining, and enforcing a consistent brand voice.

Content Creators

Producing high-frequency content while ensuring every piece is on-brand.

Our Brand Pillars

Clarity

Clear, actionable feedback

Trust

Reliable, objective evaluation

Explainability

Transparent reasoning behind decisions

Workflow Integration

Fits into real publishing workflows

Aligna creates a new category: Brand Voice QA

Most AI tools generate content. Aligna evaluates it.

Most AI writing tools focus on generation. Aligna occupies a distinct category: specialized brand evaluation with explainable, structured decisions.

- **Jasper** — Easy to use, generation-focused
- **Writer** — High rigor, enterprise governance
- **Rytr** — Lightweight tone control
- **Aligna** — Brand QA, explainability, decision-making

Instead of competing with AI writers, Aligna sits after them as a quality layer.

How Aligna communicates across platforms — thought leadership, product education, and brand storytelling

Medium → Long-form thought leadership

WORK.

Instead, brand consistency is enforced through manual review.

Someone reads the content and decides whether it “sounds right.” That process is slow, subjective, and difficult to scale.

As teams create content across many channels, maintaining a consistent brand voice becomes increasingly difficult.

The Insight That Changed Everything

While building AI workflow tools, I kept noticing something interesting.

Most AI tools focused on generating more content faster. Very few focused on helping teams decide whether content was actually on-brand. That gap felt important.

Substack → Narrative storytelling

This is what I started thinking of as the **Brand Consistency Gap**:

1. Content creation is fast
2. Brand review is slow
3. Decisions are subjective

That gap is where brand voice breaks.

And it explains why most AI writing tools don’t fully solve the problem. They make it easier to produce content, but they don’t help teams decide whether that content should actually go out.

A different way to think about it

Once you look at it this way, the problem shifts.

It’s no longer about writing better content. It’s about making better decisions about content.

That shift is subtle, but it changes everything.

Instead of asking, “How do we generate more?”, teams should be asking, “How do we decide faster and more consistently?” This is the lens that led to how Aligna was built.

Instead of generating content, Aligna evaluates it. It learns a brand’s voice from

LinkedIn banner → Brand presence

Aligna

Ensure Every Message Matches Your Brand Voice

AI-powered brand voice evaluation

From Frustration to a System Teams Can Trust

Narrative Framework: Hero's Journey

Why: It shows the transition from problem → insight → system-based solution.

Most AI tools help teams generate content faster. But teams still struggle with one question: **Does this sound like our brand?**

Brand guidelines exist, but they don't scale. Review becomes slow, subjective, and inconsistent.

That insight led to Aligna — a system that evaluates content and provides structured decisions teams can trust.

 **The goal isn't more content. It's confidence before publishing.**
